

WPI

- TI - Image display device for digital camera, PDA connected through communication network - displays image delivered from data server after identifying user based on divided information recorded on recording machine
- AB - JP11164282 NOVELTY - A communication unit connects the individual to the data server based on the individual information recorded on the external recording medium (22). An image display unit displays the image delivered from the data server.
- USE - For displaying image data received through communication network.
- ADVANTAGE - Identical images can be displayed simultaneously on several display devices. DESCRIPTION OF DRAWING(S) - The figure shows the exterior perspective diagram of the digital camera. (22) External recording medium.

PAJ

- TI - IMAGE DISPLAY DEVICE AND CAMERA, AND IMAGE COMMUNICATION SYSTEM
- AB - PROBLEM TO BE SOLVED: To provide an image display device and a camera that automatically communicate with a sever corresponding to user and integrally control a plurality of devices, and also to provide an image communication system that uses such devices to conduct distribution service of image data.
- SOLUTION: Personal information of a user recorded on an ID card 22 is received from the card read section 20 and is automatically connected to a server corresponding to the user via a communication interface. Then data of a photographed image are sent and stored to the server, and image data stored in the server are called, with its reproduced image displayed on an image display section at the rear side of a camera 10. A plurality of cameras to which the same user ID is registered are totally controlled for photographing and reproduction by one of them and one camera registering a plurality of user IDs simultaneously transfers the photographed image to the server of each user.
